

**Dear**

Please find enclosed the Primespot test results for your patient

To carry out our Primespot test, we isolated the white cells from the platelets and red cells in your patient's blood sample and collected serum for further evaluation.

Polymerase chain reaction (PCR) techniques have been performed using primers for viruses HHVs, VZV, CMV, EBV, HTLV1, HPV16, HPV 18 and XMVR. A direct PCR has been performed for DNA viruses. A two-step qPCR has been performed with relative quantification for retroviruses.

We hope that you find your results easy to understand. If you need any further help, please contact one of our expert advisers who will be happy to review the Primespot test results with you.

Yours sincerely,

**Dr Ioannis Papatiriu**
